

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The UDP protocol reveals that port 53 is unreachable at the moment. This is based on the results of the network analysis, which show that the ICMP echo reply returned the error message: UDP port 53 unreachable. The port noted in the error message is used for Domain Name Service (DNS). The most likely issue therefore is the DNS failure.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

Time incident occurred: 13:24:32.192571

Reports of several customers and clients made the IT team aware of the network issue. Afterwards, they started analyzing the network traffic to the specific website through a network analyzer tool (tcpdump) and discovered that they got the ICMP error: port 53 unreachable, which showed them that the Domain Name System server is unreachable. Likely cause of the incident is the DNS outage. It could be due to the DoS attack, or some internal related issue due to which DNS has failed.
